

$$\mathcal{S}_F = \Gamma \backslash \mathcal{D}_F$$

- proper special subvarieties Y_j
- CM points, each on some Y_j
- $y_k \notin Y_1 \cup \dots \cup Y_k$
- $p(s)$ with $\text{Hg}(A_s) = G_F$
- $p(s_0)$, the CM base point

$\Sigma_F^{\text{sp}} = p^{-1}(\bigcup_j Y_j)$ is dense,
 $G_F(\mathbb{Q})$ -stable and meagre;
the y_k are Zariski dense in $\mathcal{S}_F$
