

a lonely shift

a term at a passes through M_1, M_2, M_3 alone; each step adds $1 \bmod 4$; g odd: one shift keeps $64 \cdot 28 = 1792$

interleaved shifts

edges $A-B, A'-B'$: the cut of $A \cup B'$ in the Cayley graph of 28 ratios that move three coordinates: ≥ 640

within six values

(a) single shifts, (b) interleaved, (c), (d) a gap of four; all others by the earlier results;
green: $\dim \text{Ext}^2 \geq$
