

three consecutive shifts

a block meets one component of
Ext degree two, landing in
 $\mathcal{H}^5(c, e)$, $c \in T$, $e \in B$; runs
through the multiples $\text{drop} \geq 4$

the budget

40960 classes $\mathcal{H}^3$

targets $\leq 32 \cdot 960 = 30720$

targets $\leq 16 \cdot 1152 = 18432$

$\dim \text{Ext}^2 \geq 22528$

| 104 allowed by the criterion

counting: $\min(|T|, |B|) \cdot 960$;

eigenvalue: $16(960 - \lambda)$

eigenvalues of the targets

least $\lambda = -192$; the cut

$\zeta_3 \zeta_4 \in \{1, i\}$ weighs 18432
