

$$\omega(A_1) \omega(A_2) = \omega(A_1 \times A_2)$$

$$\bigwedge_K^{2n} (V_1 \oplus V_2) = \bigwedge_K^{2n_1} V_1 \otimes \bigwedge_K^{2n_2} V_2$$

so algebraicity passes from the factors to the product,
and at $n = 1$ the factors are divisors

shaded: the codimension $\binom{n}{2}$ of a quaternionic locus;
from $n = 2$ on every known locus is a proper subvariety
